

Ideation Phase

Brainstorm & idea prioritization

Date	8 MARCH 2026
Team ID	SWTID-2026-2031
Project Name	Automating Data Import and Relationship Mapping using Import Sets and Dot Walking
Maximum marks	4 Mark

Problem Statement

Organizations often receive employee information from external systems such as spreadsheets or databases. Entering this data manually into the ServiceNow platform can be time-consuming and may lead to errors or inconsistencies. To improve efficiency and accuracy, the organization wants to automate the import of employee data including **Name, Email ID, Phone Number, Department, and Manager details**.

After importing the employee data, when an **Incident** is assigned to an employee, the system should automatically display related information such as the employee's **department, email ID, and manager** using **Dot Walking**. In addition, the **Priority field** in the Incident table should have a customized default value different from other tables inherited from the **Task table**.

Objective

The objective of this project is to automate the data import process and establish relationships between tables in ServiceNow using built-in platform features.

The key objectives include:

- Import employee data automatically from an external spreadsheet
- Store the imported data in the ServiceNow **User table**
- Access related data using **Dot Walking** without opening referenced records
- Customize the **Priority field default value** using Dictionary Override
- Improve system efficiency and reduce manual work

Skills Used

- Import Sets
- Transform Maps
- Field Mapping
- Dot Walking
- Dictionary Override
- ServiceNow Data Management

TASK INITIATION

Milestone 1: Import Data from Data Source

Activity 1: Create Records in Spreadsheet

1. Open **Google Sheets** or **Microsoft Excel**.
2. Create the following column headers:
 - Name
 - Email ID
 - Phone Number
 - Department
 - Manager
3. Enter the employee records as shown below.

Employee Data

Name	Email ID	Phone Number	Department	Manager
K.Aishwarya	23ucs504@avasctnj.edu.in	9629196513	CS	K.Aishwarya
M.Divya	23ucs522@avasctnj.edu.in	8072897312	CS	K.Aishwarya
S.Boomika	23ucs518@avasctnj.edu.in	9865775366	CS	K.Aishwarya
I.Abinaya	23ucs501@avasctnj.edu.in	7373952828	CS	K.Aishwarya

4. Save the file as:

[illegible]

employee_import_data

5. Download the file in one of the following formats:

- .xlsx
- .csv
- .xml

Activity 2: Import Data into ServiceNow

1. Open the **ServiceNow** instance.
2. Click **All** in the navigation bar.
3. Search for **Import Sets**.
4. Select **Load Data** under **System Import Sets**.
5. Choose **Create Table**.
6. Enter the Import Set table name as:
7. **Import Employee Data**

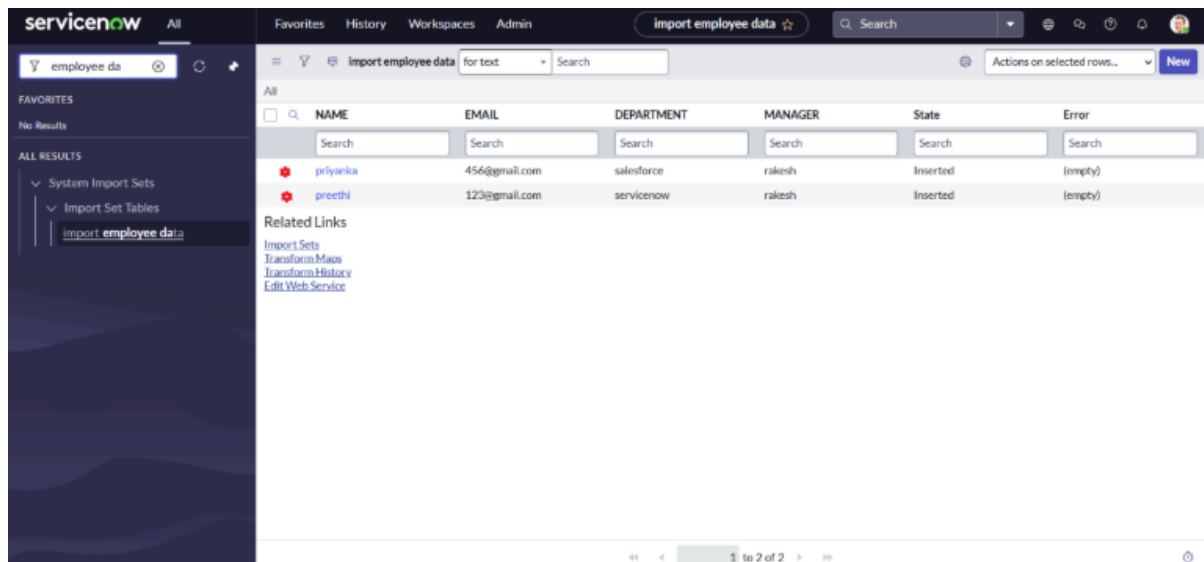

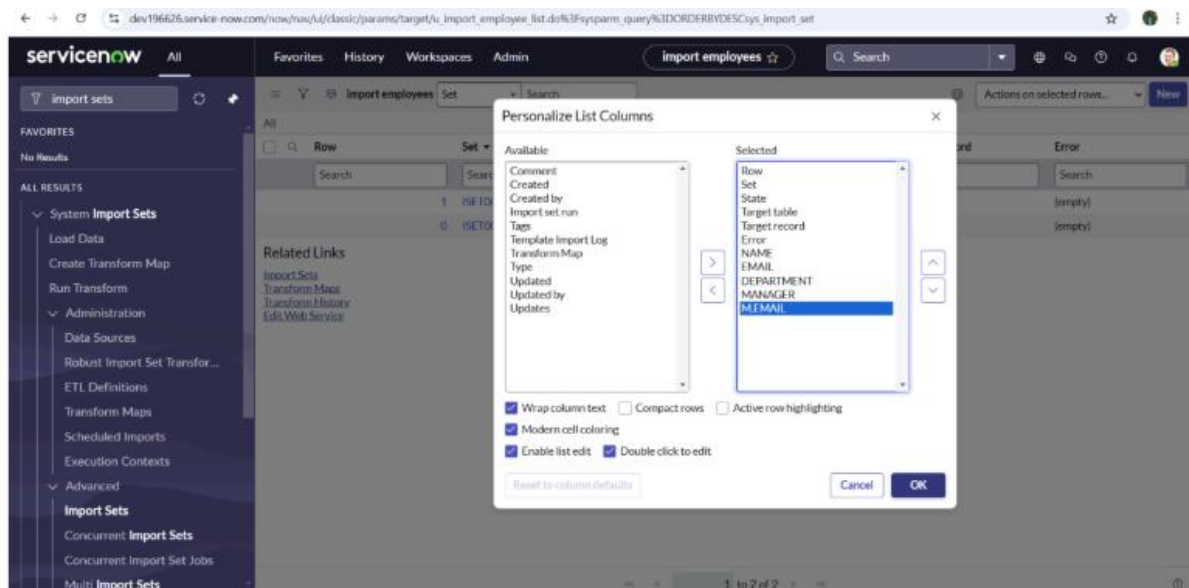

The screenshot shows the ServiceNow 'Load Data' form. The left sidebar displays the navigation menu with 'Import set' selected. The main form area is titled 'Load Data' and contains the following fields:

- Import set table:** Radio buttons for 'Create table' (selected) and 'Existing table'.
- Label:** Text input field containing 'Import employee'.
- Name:** Text input field containing 'u_import_employee'.
- Source of the import:** Radio buttons for 'File' (selected) and 'Data source'.
- File:** Text input field containing 'Choose File' and 'employee data.xlsx'.
- Sheet number:** Text input field containing '1'.
- Header row:** Text input field containing '1'.
- Submit:** A blue button at the bottom right of the form.

7. Upload the file created in the spreadsheet.

8. Click **Submit**.

The data will now be uploaded into the **Import Set** staging table.

Activity 3: Create Transform Map

1. Navigate to **System Import Sets** → **Transform Maps**.
2. Click **New**.
3. Fill the details as follows:

Name:

Employee Data Transform Map

Source Table:

Import Employee Data

Target Table:

User [sys_user]

4. Click **Submit**.

The Transform Map defines how data from the **Import Set table** moves into the **User table**.

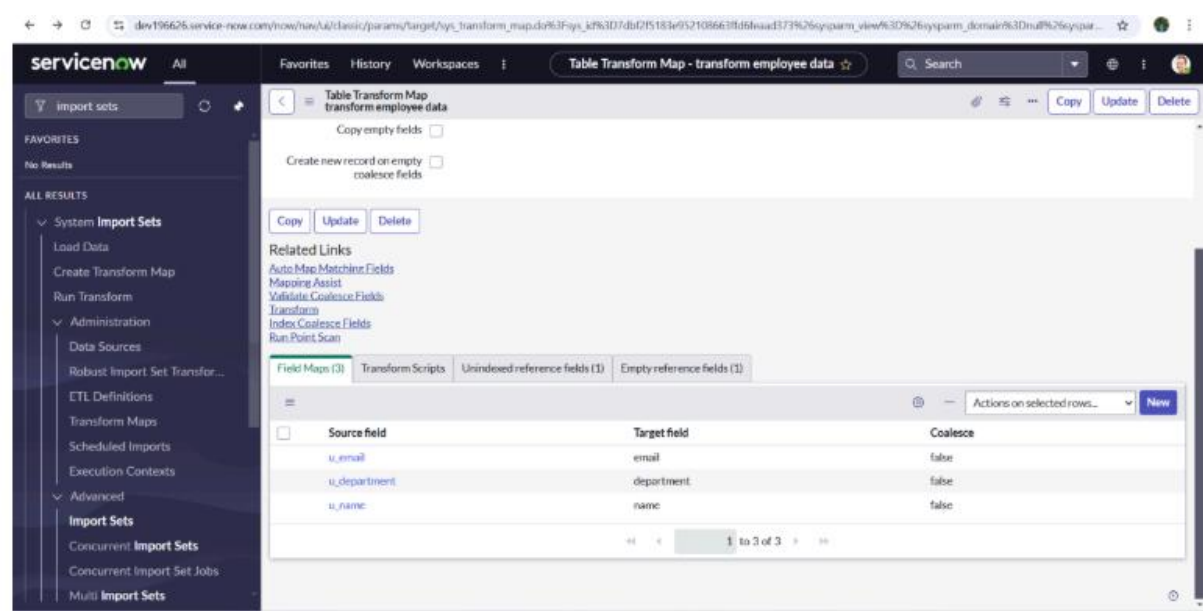

The screenshot shows the ServiceNow interface for configuring a Table Transform Map. The left sidebar displays the navigation menu with categories like 'Import sets', 'System', 'Administration', and 'Advanced'. The main content area is titled 'Table Transform Map - transform employee data'. It includes fields for Name, Source table, Active status, Run business rules, Enforce mandatory fields, Copy empty fields, and Create new record on empty coalesce fields. The Target table is set to 'User [sys_user]' and the Order is 100. Below these fields are 'Copy', 'Update', and 'Delete' buttons. A 'Related Links' section provides links to 'Auto Map Matching Fields', 'Masking Assist', 'Validate Coalesce Fields', and 'Run Point Scan'. At the bottom, there is a 'Field Maps' section with a table structure for mapping source fields to target fields and coalesce fields.

Source field	Target field	Coalesce

Activity 4: Map the Fields

1. Open the created **Transform Map**.
2. Scroll down to the **Field Maps** section.
3. Click **Auto Map Matching Fields**.
4. Verify the mapped fields.

Example

Source Field Target Field

Name Name

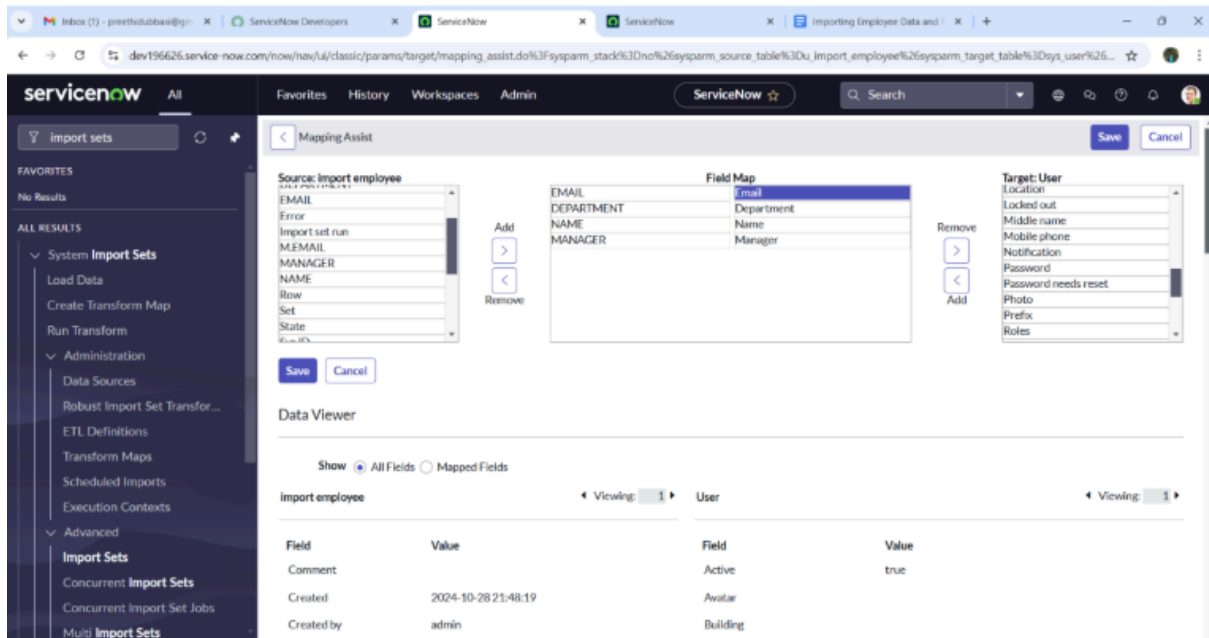

Email ID Email

Phone Number Phone

Department Department

Manager Manager

- 5. Use **Mapping Assist** to manually map any unmatched fields.
- 6. Click **Save**.

Activity 5: Transform the Data

1. Open the Import Set record.
2. Click **Transform** in the Related Links section.
3. Click **Transform** again to start the transformation process.

After transformation:

- Employee records will be inserted into the **User Table (sys_user)**
- Data becomes available for use within ServiceNow

Milestone 2: Relationship Mapping using Dot Walking

Dot Walking allows users to access related table information without opening the referenced record.

Activity 1: Display Department Information on Incident Form

1. Navigate to:

All → Incident

2. Click **New** to create a new incident record.

Initially the form does not show employee department or manager details.

3. Right-click the form header.
4. Select **Configure → Form Layout**.

Activity 2: Add Dot Walking Fields

Add the following fields using Dot Walking:

Assigned to.Department

Assigned to.Email

Assigned to.Manager

5. Click **Save**.

Activity 3: Verify Dot Walking Functionality

1. Open a **New Incident record**.
2. Fill mandatory fields such as:
 - Short Description
 - Category
3. In the **Assigned To** field, select one of the imported employees.

Example:

K.Aishwarya

Once selected, the system will automatically display:

- Department
- Email
- Manager

This occurs because **Dot Walking** retrieves related information from the **User table** automatically.

Milestone 3: Dictionary Override

Dictionary Override is used to modify field properties in extended tables without affecting the parent table.

Activity 1: Understand Table Inheritance

The **Incident table** is extended from the **Task table**.

Therefore, it inherits fields such as:

- Priority
- State
- Assigned To

By default, the **Priority field value** in the Task table is:

4 – Low

Activity 2: Create Dictionary Override

1. Navigate to:

System Definition → Tables

2. Open the **Incident table**.
3. Locate the **Priority column**.
4. Scroll down to **Dictionary Overrides**.
5. Click **New**.

Enter the following details:

Table:

Incident

Column Name:

Priority

6. Enable:

✓ Override Default Value

7. Set default value:

3 – Moderate

8. Click **Submit**.

The screenshot displays the ServiceNow 'Incident - Create INC0010058' form. The interface includes a left-hand navigation menu with various tools like Self-Service, Access Analyzer, and Activity Subscriptions. The main form area is divided into several sections. The top section contains fields for 'Number' (INC0010058), 'Caller' (Abel Tuter), 'Category' (Inquiry/Help), 'Subcategory' (None), 'Service', 'Service offering', and 'Configuration item'. The right section contains fields for 'Channel' (None), 'State' (New), 'Impact' (3 - Low), 'Urgency' (3 - Low), 'Priority' (5 - Planning), 'Location' (SHS quadra 5, Bloco E, Brasil), and 'Assignment group'. Below these, the 'Assigned to' field is highlighted with a red box, showing 'prityanka b'. Other fields in this section include 'Email' (pritya@gmail.com), 'Department' (salesforce), and 'Manager' (rakesh). The bottom section contains a 'Short description' field with the text 'dot walking' and a 'Description' field.

Field	Value
Number	INC0010058
Caller	Abel Tuter
Category	Inquiry/Help
Subcategory	None
Service	
Service offering	
Configuration item	
Channel	None
State	New
Impact	3 - Low
Urgency	3 - Low
Priority	5 - Planning
Location	SHS quadra 5, Bloco E, Brasil
Assignment group	
Assigned to	prityanka b
Email	pritya@gmail.com
Department	salesforce
Manager	rakesh
Short description	dot walking
Description	

Activity 3: Verify the Override

1. Open **All** → **Incident** → **New**.
2. Check the **Priority** field.

The default value will now be:

3 – Moderate

This change only affects the **Incident table** and does not modify the parent **Task table**.

Conclusion

In this project, the process of importing employee data into ServiceNow was automated using **Import Sets and Transform Maps**. The imported data was successfully stored in the **User table**, allowing the system to manage employee information efficiently.

Using **Dot Walking**, related information such as department, email, and manager details could be accessed directly within the Incident form without opening additional records. Furthermore, **Dictionary Override** allowed customization of the Priority field specifically for the Incident table without affecting other tables.

This implementation improves **data accuracy, reduces manual work, and enhances the overall efficiency of the ServiceNow incident management process**.
